Inspiring innovation.

ENARTIS

Elevate the overall quality and value of our customers' offerings through integrated solutions.

Reducing dependency on chemical inputs while maintaining wine quality is one of the key challenges facing the wine industry today. In LIGAWINE, Enartis is contributing to this transition.

As a global player in oenological solutions, Enartis develops products and technologies designed to support winemaking processes worldwide. With a strong focus on **innovation and sustainability**, the company works closely with wineries to improve quality, efficiency, and environmental performance.

Within LIGAWINE, Enartis contributes as a **large-scale investment partner** in Work Package 4 by developing and validating a new protocol for the retrieval of unstable protein in the wine. This protein would then be tested to see if it can be used in the vineyard as a **biocontrol solution**. This innovation aims to provide an effective alternative to conventional pesticides while reducing inputs in the winery, aligning with European objectives for more sustainable agriculture.

A key aspect of its role is the adaptation and validation of its technology across different European wine regions, taking into account local conditions such as grape varieties and production systems. This **real-scale validation is essential** to ensure the robustness and scalability of the solution.

As the only non-SME involved in the project, Enartis also brings **valuable expertise and an extensive international network**, supporting the dissemination and market uptake of complementary innovations developed within LIGAWINE.
